

Birds of the Gila National Forest: A Checklist

United States
Department of
Agriculture

PREPARED BY
Forest
Service

Southwestern
Region

PRODUCED IN COOPERATION WITH
Dale A. Zimmerman, Ph.D.
Southwest New Mexico Audubon Society

Using the Checklist

The first column after the species name is an indication of the bird's abundance. Bear in mind, however, that many species are locally distributed and do not range throughout the Gila National Forest which embraces a highly diverse range of elevations and habitats (see below). Thus, the expressions of abundance are to be viewed as *general* indications, and of course only for the habitat(s) favored by the species in question. Abundance also varies seasonally, and often from year-to-year as well. Additionally, actual abundance is often distinct from *detectability*. Some species may be common but secretive and only rarely seen. Others may be numerically sparse, yet highly vocal or otherwise conspicuous. The following designations relate to abundance, not necessarily to frequency of detection. An asterisk (*) following a species name indicates breeding on the Gila National Forest.

A - Abundant

F - Fairly Common

R - Rare

C - Common

U - Uncommon

The second column reflects seasonal status, showing the time of year when the species normally appears in the checklist area:

P - Permanent Resident (present year-round)

S - Summer Resident (present from spring until fall migration) **or Summer Visitor** (not known to breed on the Gila)

W - Winter Resident (typically from October through March)

T - Transient (present as a migrant in spring and/or fall)

V - Visitant (present at various seasons, often irregularly)

The remaining columns indicate the usual habitat(s) of each species. On the forest, vegetation types range from spruce/fir forest high in the Mogollon Mountains to desert scrub and remnant grassland in the lower Burro Mountains. Small expanses of grassland are scattered in the higher ranges. Generally, ponderosa pine is the dominant species at elevations between 6,000 and 7,000 feet. Somewhat higher, and in many canyons, is a mixed conifer forest typically dominated by Douglas-fir, often with Gambel's oak. Woodlands of piñon pine, juniper and oak, in varying combinations, are present on drier sites throughout the forest. Riparian areas support rich deciduous or coniferous woodland and, locally, small areas of marsh or other open habitats. This great ecological diversity provides for a remarkably varied bird fauna. This checklist includes 166 species known to breed on the Gila, 114 others that are more or less regular non-breeders, and 57 species considered to be casual (recorded 3-5 times) or accidental (recorded but once or twice).

	Abundance	Residence	Desert	Oak Woodland	Oak-Juniper	Pinyon-Juniper	Ponderosa Pine	Spruce-Fir	Mt. Grassland	Marsh/Open	Decid. Riparian	Conif. Riparian
